EVERYBODY WINS!

DESIGNED TO MEET THE NEEDS OF GROWING COMMUNITIES

Enabling builders, municipalities and homeowners
to create water-efficient communities.

Many municipalities are recognizing the benefits of residential water recycling to conserve regional water supplies and create water-efficient communities, especially in areas where growth is constrained by limited water resources.

“Our water conservation strategies, which includes solutions like Greyter HOME is worth anywhere from 70 to 110M in avoided future costs for developing new water supplies.

Mark Marlowe, Director Castle Rock Water

“This has the potential to further drive down indoor water use, help us assess the effectiveness of greywater systems in a residential setting and continue to advance the ball on water conservation... Making more efficient use of greywater and stormwater for purposes such as toilets or irrigation is going to be an important part of our stewardship of Colorado’s most precious resource.”

Jeff Tejral, Manager of Water Efficiency at Denver Water.

The Greyter HOME plays an important part in helping municipalities implement long term, sustainable water management strategies and its use in new home construction could enable builders to achieve municipal incentives for water conservation.

The Greyter HOME™ can assist Florida developer’s with density bonuses as a result of the passing of SB 64 in 2021. In Colorado, Castle Rock Water offers developers tap fee discounts if they hit specific water conservation measures, and the Greyter HOME can assist builders meeting those targets.

“We welcome the opportunity to be a pioneer in implementing exciting new technologies with significant benefits to our environment, community, and customers,”

Tom Gansheimer, Lennar’s Tucson Division President.

“We applaud Greyter’s efforts to increase the water efficiency of our homes and believe innovative water technologies like the Greyter HOME can become a valuable tool in meeting water conservation goals in many markets.”

Jim Petersen, Vice President of Research and Building Technology for Lennar Homes.

Over the long term, the Greyter HOME also contributes to a sustainable water management strategy for the community and helps homeowners save money on water and sewer costs.

I’ve had my Greyter HOME since May 2017 when I signed on as a field tester. I believe I have the experience to be helpful in answering a simple question for a prospective home owner... after all is said and done, would I want a Greyter unit in my home? The answer is a resounding YES! You want a Greyter in your home.
